

4. Introduction to ArcGIS

Objectives

1. You should be able to navigate with ArcGIS interface and component tools

What is ArcGIS?

- ArcGIS is a family of software products from GIS

Industry leader  **esri** Understanding our world.

ArcGIS

ArcGIS is a complete system for designing and managing solutions through the application of geographic knowledge.

- **ArcGIS for Desktop**
- ArcGIS for Mobile
- ArcGIS for Server
- ArcGIS Online

What's New in ArcGIS 10 »

Data

Esri data provides a range of ready-to-use, high-quality data for your GIS visualization and analysis projects.

- Basemaps
- Imagery Data
- Demographic, Consumer, and Business Data
- Free Data

Developer Tools

Developer tools allow you to add mapping to your web, mobile, and desktop applications using a choice of languages.

- Esri Developer Network
- Mobile Runtime SDKs
- Web APIs

What is ArcGIS?

- We will be using ArcGIS Desktop
- Three licensing levels:
 - Basic/ArcView – basic desktop package, \$
 - Standard/ArcEditor – adds comprehensive editing, \$\$
 - Advanced/ArcInfo – adds advanced spatial analysis and high-end cartography, \$\$\$
- We are using ArcInfo

What is ArcGIS?

- ArcGIS Desktop application suite:

- ArcMap
- ArcCatalog
- ArcScene
- ArcGlobe

- Other components include

- ArcToolbox and ModelBuilder
- ArcGIS Administrator

What is ArcGIS?

- How do you access these?
- From the start menu
 - >> All Programs
 - >> ArcGIS

ArcCatalog

- for organizing and managing spatial and tabular data

Main menu
Standard Toolbar

Catalog tree

Catalog display

ArcCatalog

- Once a network share is mapped as a drive letter, you can create a connection to it or one of its subfolders

ArcCatalog

- For instance, here are the contents of the nr143 folder on my Zoo account, which I made a folder connection to:

ArcCatalog

- There are five types of data shown here

The screenshot displays the ArcCatalog interface. On the left, the 'Catalog Tree' shows a folder structure under 'Folder Connections', including 'C:\Temp' and 'Z:\nr143'. The 'Z:\nr143' folder is expanded, showing subfolders '2011', 'img', and 'lab1' through 'lab9', along with 'tmp' and 'VCGI.mdb'. The 'lab4' folder is selected. On the right, the 'Contents' tab is active, showing a table of data items. Blue arrows point from labels on the right to specific items in the table: 'Geodatabase' points to 'lab4_data.mdb', 'Coverage' points to 'counties' and 'geol', 'Arc Map Project file' points to 'lab4.mxd' and 'temp.mxd', 'Shapefile' points to 'geology.shp', 'invert.shp', and 'vegetation.shp', and 'Tabular data' points to 'vt_01_06_table.xlsx' and 'vt_01_BPR.dbf'.

Name	Type
lab4_data.mdb	Personal Geodatabase
counties	Coverage
geol	Coverage
geology.shp	Shapefile
invert.shp	Shapefile
lab4.mxd	Map Document
temp.mxd	Map Document
trails.shp	Shapefile
vegetation.shp	Shapefile
vt_01_06_table.xlsx	Excel File
vt_01_BPR.dbf	dBASE Table

Geodatabase

Coverage

Arc Map Project file

Shapefile

Tabular data

Data types

- **Shapefile**: native file format for ArcView 3.x

Windows Explorer (file system) view:

parcel_clip.dbf	11/9/2009 12:54 PM	DBF File	160 KB
parcel_clip.sbn	11/9/2009 12:54 PM	SBN File	96 KB
parcel_clip.sbx	11/9/2009 12:54 PM	SBX File	5 KB
parcel_clip.shp	11/9/2009 12:54 PM	SHP File	4,257 KB
parcel_clip.shp.xml	11/9/2009 12:54 PM	XML file	8 KB
parcel_clip.shx	11/9/2009 12:54 PM	SHX File	76 KB

One spatial data layer, several files

Data types

Windows Explorer (file system) views:

- **Coverage:**
native file
format for old
ArcInfo 7.x
(not a file, but a
complex
directory
structure)

Copy/move/rename the coverage folder in Windows Explorer and you corrupt the whole workspace! (Use ArcCatalog to manage spatial data layers)

Data types

- Tabular data: data table (often non-spatial) that can be used in a GIS
 - Spreadsheet
 - Dbase database file -- .dbf
- Map document: a project file—it stores your map layout and preferences in ArcGIS....but not the data!

Data types

- **Geodatabase (GDB):** This is ArcGIS's newest data model for storing geographic information
 - A geodatabase can contain many layers, known as “feature classes.” Shapefiles have only one layer.
 - As an example, here is a geodatabase with three feature classes, as seen in Arc Catalog

Feature classes

- In a geodatabase there are features classes for points, lines and areas (polygons) as well as for rasters (surfaces), annotation (labels), and dimensions

Polygon, or area feature class

Line, or arc feature class

Annotation class: stores info about displaying labels on a map layer; important for roads and utilities

Name
Anno_2_22
Dimensions
Parcels
Road_cl
Road_eop
RoadNames
RRline

Feature dataset

- Feature dataset: a thematic grouping of feature classes
- Feature classes can be stand alone (do not have to be within a feature dataset)

Geodatabase

- Geodatabases offer numerous advantages:
 - Multiple spatial layers and non-spatial data sources can be stored in a single file (personal GDB) and organized thematically
 - Rules can be easily defined that can apply to all classes
 - These rules can include relationships between layers
 - Example: one subclass with water lines and one with water valves; you can ensure that if you move a water line, the water valve that connects that line will move as well, or it ensures that, say, if the material attribute for a water line is set to copper, the water valves that connect to it will also be copper

Geodatabase

- Other advantages:
 - Spatial layers maintain the same measurement and geographic reference systems, because new layers added to the geodatabase can “inherit” properties of existing ones
 - Labeling “behavior” can be stored as an annotation feature class, making it easier to keep labels consistent
 - “Domains” can be established, which specify the valid ranges of values for attributes, which reduces input error.

Geodatabase

- Types: Personal, File or Enterprise (multi-user)
 - We will use personal geodatabases. These are actually Microsoft Access files with the .MDB file extension.
- A screenshot of a file explorer window showing a file named 'Lab8.mdb'. The file icon is a small blue square with a white 'd' inside. To the right of the icon, the text 'Lab8.mdb' is displayed. Further right, the date and time '11/5/2009 9:47 AM' are shown. To the far right, the text 'Microsoft Office Access Database' is visible. The entire screenshot is enclosed in a thin black border.
- We may also use the newer *file* geodatabases. These are a multi-file-within-folder model similar to a *coverage*, but easier to manage. The folder has a .GDB extension.
 - A multi-user (SDE) geodatabase is for organizations that wish to have many people accessing the same database. These are used with enterprise database systems, like Oracle, Informix or SQL Server

Personal Geodatabase

- View of a geodatabase in MS Access, where you can edit and query attribute tables and manage relationships between feature classes....
- Can only view spatially in ArcGIS (not in Access)

ArcCatalog: Data management

- Create and modify geodatabases.
- You can create new feature classes, tables or relationship classes within a geodatabase

ArcCatalog: Data management

You can also import existing shapefiles or coverages into a geodatabase or export a feature class to a shapefile

ArcCatalog: Data management

Through right clicking, you can access the properties of a feature class and make changes ...
e.g., alter fields for the feature class' attribute table

ArcCatalog: Online data

- ArcCatalog also allows you to access data directly from the Internet

ArcCatalog: Online data

ArcGIS Online
(arcgis.com)

ArcCatalog: Functionality

- ArcCatalog allows you to preview geographic data, including geodatabase feature classes

ArcCatalog: Functionality

- You can also preview online data sets

ArcCatalog: Functionality

...and you can
preview and browse
tabular attribute data

ArcCatalog: Functionality

- Preview, create and modify the “metadata,” or data about the data

ArcMap

- ArcMap is where you'll do most of your mapping and visualization of spatial data
- This is the default upper tool and menu bar

ArcMap: overlaying data

- Using the add data button, you can overlay any number of layers for which geographic reference information exists.

ArcMap: Table of Contents

- The window on the left side of ArcMap is the Table of Contents, where project data layers are listed
- There are several TOC views, including display and source

ArcMap: properties

- You can access many functions by right clicking on the layer in the TOC.

You can
access, edit
and query
attribute
tables from
a special
interface

ArcMap: Layer properties

- You can access layer properties by double clicking on that layer: much functionality is found there

ArcMap: Data frame

You can access properties for the whole data frame by double clicking on “Layers” at the top of the TOC or by right clicking on the data frame

ArcMap: Content Pane

- ArcMap can view in two modes:

Data view: for viewing, analyzing and manipulating data

Layout view: for laying out data for presentation

ArcMap: Layouts

Maps are created in the layout view, where titles, legends, north arrows, scale bars, and other elements can be added and arranged.

ArcMap: Data frame—Units

- Two of the most important properties are Map and Display units. Where the Map units are already set (because reference info exists) they will be “grayed out” but display units are still changeable.

When the units are unknown to the system (reference info not embedded in the file) you'll see:

This turns into guesswork

ArcMap: Units

- Once you've set display units, future geographic measurement functions should be in those units, even if they're different from the Map units; however, this does not apply to non-spatial attribute values
- If you use the ruler tool for instance, measurements will likely be in the selected Display units at the bottom of the page unless you've selected different units in the ruler tool interface

ArcMap: Scale

- Translation factor between one unit on the map and same unit in the real world
 - map units: ground units (ratio)
 - 1:10,000 means that 1 cm equals 10,000 cms in real world

1cm is 1.98 million cm in real world

- Scale is a dimensionless number

Large vs. Small Scale

- Large scale
 - Lots of detail
 - Shows small features
- Small scale
 - No much detail
 - Shows large features

Large vs. Small Scale

1:21,197,708

1:3,125,078

1:30,137

1:5,269

ArcGIS: Extensions

- Specialized applications
 - 3D Analyst
 - Spatial Analyst
 - Geostatistical Analyst
 - Tracking Analyst, X Tools...
 - Others...

ArcGIS: Extensions

- Activate by going to Customize>>extensions

ArcMap: Toolbars

- When you load ArcMap it defaults to a state with a minimum of toolbars. You can add more toolbars and extensions from the Customize menu (Customize >>> Toolbars).

ArcToolbox

- Embedded within both ArcMap & ArcCatalog

ArcToolbox

- Advanced Analyses
 - Extract
 - Overlay
 - Erase
 - Identity
 - Intersect
 - Spatial Join
 - Symmetrical Difference
 - Union
 - Update
 - Proximity
 - Statistics
- Cartography Tools
- Conversion Tools
- Data Interoperability Tools
- Data Management Tools
 - Data Comparison
 - Database
 - Distributed Geodatabase
 - Domains
 - Feature Class
 - Append Annotation Feature Classes
 - Calculate Default Spatial Grid Index
 - Calculate Default XY Tolerance
 - Create Feature Class
 - Create Fishnet
 - Create Random Points
 - Integrate
 - Update Annotation Feature Class
- Features
- Fields
- File Geodatabase
- General
- Generalization
- Graph
- Indexes
- Joins
- Layers and Table Views
- Package
- Projections and Transformations

ModelBuilder

- An application for building models – workflows that string together sequences of tools

ArcScene

Primarily for viewing 3D data
